Purification and characterization of thin, aggregative fimbriae from Salmonella enteritidis.";

Salmonella enteritidis.";

J. Bacteriol. 173:4773-478(11991).

FUNCTION: CURLIN IS THE STRUCTURAL SUBUNIT OF THE CURLI. CURLI ARE COLLED SURFACE STRUCTURES THAT ASSEMBLE PREFERENTIALLY AT GROWTH TEMPERATURES BELOW 37 DEGREES CELSIUS. CURLI CAN BIND TO FIBRONECTIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRAIN=K12;

-!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.
-!- SUBCELLIDAR LOCATION: Outer membrane (By similarity).
-!- DOMAIN: CONTAINS 153 IMPERFECT REPEATS OF THE CONSENSUS OCTAPERTIDE A-G-Y-G-S-T-L-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERCOICITY IS SUPERIMPOSED.
-!- MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
-!- SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE FROM N.A.

S8:762-764(1994).

FUNCTION: I ce mucleation proteins enable bacteria to nucleate crystallization in supercooled water.

SUBCELLULAR LOCATION: Outer membrane.

DORAIN: CONTAINS: MPRREECT REPEATS OF A CONSENSUS OCTAPEPTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.

MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE MISCELLANGOUS: A STRUCTURAL MODEL IS SUGGESTED TO THAT OF ICE.

SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -:- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.
-:- SUBCELLULAR LOCATION: Outer membrane.
-:- DOMAIN: CONTAINS 126 IMPRERET REPEATS OF A CONSENSUS OCTABEPTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERINFOSED.
-:- MISCELLANEOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
-:- SIMILARITY: Belongs to the bacterial ice nucleation protein

MEDLINE=90092494; PubMed=2599095;

The ice inucleation active gene of Erwinia ananas. Sequence similarity to those of Pseudomonas species and regions required for ice incleation activity.",

Thucleation activity.",

FEBS lett. 258:297-300(1989).

The PubCilon: Ice nucleation proteins enable bacteria to nucleate or ystallization in supercooled water.

The PubCilon: Ice nucleation proteins enable bacteria to nucleate or ystallization in supercooled water.

The DOMAIN: CONTAINS MANY IMPERFECT REPEATS OF THE CONSENSUS OCTAPEPTIDE A-G-T-X-T, FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PRESIDUE THE PROTEIN ICE nucleation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GGGNSSGPDSTLSIYQYGSANAALALQSDARKSETTITQSGYGNGADVGQGADNYDQLVT

J. Biol. Chem. 267:1888-1895(1992).

-!- FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

-!- GATALYHIC ACTIVITY: Preference for hydrophobic residues at P1 and P1 and basic residues at P2 and P3'. A model nonapeptide is cleaved at -Ala-Tyre'-Leu-Lys-Lys-.

-!- COPACTOR: Binds 1 zinc ion per subunit (By similarity).

-!- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.

-!- SIMILARITY: Belongs to peptidase family M8.

```
copy of that gene, and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or the containing a replacement segment or actid sequence or sequences grown on a Salmonella, E. coli or the contained in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and incorpusation of the present invention
                                                                                                                                                                                                                                                                                                                                                                                           ó

The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment of thin aggregative finbriae (SEP17/7AR) mucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and attered for the production of fimbriae comprising recombinant Garacembination of a recombinant gene are directing recombination of a recombinant gene are into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer response in an animal, comprising separating an amino acid polymer comprising a recombinant and protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, B. coli or acid sequence or sequences grown on a Salmonella, B. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for a useful in emunogens, which may be important for directing an immune response in manimal in response in manimal are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKN-----YDQ 113

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA control of the encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbried (SEPIJ/TAP) nucleation depended assembly system of strains of Salmonella Escherichia coli and control of the production of finbria copi and control of the production of finbria comprising recombination of a recombination of a recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating a manino acid polymer comprising a recombinant part of protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or comprising separating an amino acid polymer comprising the mina in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for celiciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response consideration of the present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SDARKSETTITOSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNYDQLVTRVVT 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA seguence which encodes a foreign epicope or antigen. Also described are:

(1) use of thin aggregative finbriae (SEPI7/TAP) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacterriaceae for the production of finbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacterriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluter. (I) is useful for the expression of recombinant AgfA protein into the animal in conjunction with a carrier of diluter. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the the response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 coppies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response in mannagens, which may be important for directing an immune response in mannagens, which may be important for directing an immune response in mannagens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                   Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 151;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents agfA encoded by the full agfA gene derived from Salmonella enteritidis 27655-3b. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNYDQLVTRVVT 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA concewhich encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SPEPA)/TAP) nucleation depended assembly system of strains of Salmonella Escherichia coli and concern the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the homologue fimbriae comprising recombinant of a recombinant gene into the chromosome of the homologue species, replacing the native comprising separating an amino acid polymer comprising a recombinant gene comprising separating an amino acid polymer comprising a recombinant of cortaining a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino cortaining a natural no acid polymer comprising a replacement segment or segments of foreign amino cortaining an amino acid polymer comprising a replacement segment or segments of foreign amino cortaining a natural in conjunction with a carrier or diluent. (I) is acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which as useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response consecution, the carrier fimbrial subunit proteins are usually strong against the inserted epitope, and hybrid fimbriae are easy and given in the exemplification of the present invention
                                                                                                                                                                                                         Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

```
The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are:

(1) use of thin aggregative fimbriae (SETI/TAF) mucleation depended assembly system of strains of Salmonella, Escherichia coli and casembly system of strains of Salmonella, Escherichia coli and content of gene of strains of salmonella, Escherichia coli and complete in a precupinant gene into the chromosome of the homologous species, respectively; (2) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene, and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing in conjunction with a carrier or diluent. (1) is polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to colicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogenicity and adhesion properties relevant for an efficient live the expensive to purify in large amount. The present sequence is given in examination of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 LVTRVVTHEMAHAGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

vaccine; immune response; immunogen.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA or sequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative finhuriae (SFF)/TAF) nucleation depended assembly system of strains of Salmonella. Escherichia coli and context accase for the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the chromosome of the homologous species; (3) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of foreign and an amino acid polymer comprising a recombination of a recombination of foreign amino acid sequence or sequences grown on a Salmonella. E. coli or acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the colymer into the animal in confunction with a carrier or diluter. (1) is cuseful for the expression of recombinant AgfA protein which is useful for electing an immune response in an animal. In a fimbrial presentation of system the hererologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrial subunit protein possesses both the immuned in mind an immune response of intervent for an efficient live immunorance which an immune an immune are immuned an immune in immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an immune an Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal. vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention Salmonella; agfA; chromosomal gene replacement; fimbrin; epitope; Length 151; AgfA::PT3#6 amino acid sequence SEQ ID NO:22. The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative finbriae (SEPI)/TAFD nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacceriaceae for the production of finbriae comprising recombinant AgfA, CSA, and AgfA-homologue finbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologue species, (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for every the homologue fin an animal. In a fimbrial presentation every manner than the homologue for an animal. In a fimbrial presentation Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal. 61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNYDQLVTRVVT 120 61 SDARKSETTITQSGYGNGADVGQGAD--------NYDQLVTRVVT 97 system the heterologous antigens are presented in high numbers (up to 550,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in

Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. [1] is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response againer the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention

cc assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and strains of Salmonella, Escherichia coli and strains of Salmonella, Escherichia coli and strains of Salmonella, Escherichia comprising recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising are main acid polymer comprising are combinant gene comprising a replacement segment or segments of foreign amino acid polymer comprising are combinant part protein containing a replacement segment or segments of foreign amino acid polymer into the animal in conjunction with a carrier or diluter. (I) is notymer into the animal in conjunction with a carrier or diluter. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the the networlogous are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein sequence is given in immunogens, which may be important for directing an immune response in mount in the present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA control of the encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SPETA/TAP) mucleation depended assembly system of strains of Salmonella. Escherichia coli and control of the adgraderized and AgfA-homologue fimbriae (SPETA/TAP) mucleation depended assembly system of a recombination of a recombinant gene into the chromosome of the homologue fimbriae species; (3) directing recombinant gene into the chromosome of the homologue species; (3) directing recombinant gene into the chromosome of the homologue species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal. Comprising separating an amino acid polymer comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences in an animal in a contrier or diluent. (I) is useful for the expression of recombinant AgfA protein which and adhesion properties relevant for an efficient live and manned the inspection of the present invention immune response in an animal in control publify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                      The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA compared by the modded a foreign extendingen. Also described are: (1) use of thin aggregative finabriae (SERIA/TAP) mucleation depended assembly system of strains of Salmonella Escherichia coli and context of the production of finabriae comprising recombinant of a recombination of a recombination of a recombinant gene into the chromosome of the homologue species; (3) directing recombination of a recombinant gene copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant path of protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for cellciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to concept, and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response capaning the present equence is given in the expensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The invention relates to an isolated peptide capable of binding a mammalian plasma protein or of generating an immune response in a mammal selected from sequences shown in ABR82642, ABR82648-49. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia oli, Salmonella or Shigella infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 SDARKSETTITOSGYGNGADVGOGADNSTIELTONGFRNNATIDOWNAKNYDQLVTRVVT 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella

Sequence 171, Application US/09198452A
Patent No. 6559294
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragment:
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prev.
TITLE OP INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/09/198,452A
CURRENT FILING DATE: 1998-11-24
NUMBER OF, SEQ ID NOS: 6849
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              419 LLKSSASASASASASASASAG-----GGGGGGNGGGNGGGG------GGGAGALA----460
